HW2

Final Two App Ideas

(1) Rotten Tomatoes Futures Application

Why I want to build it:

Rotten Tomatoes Futures is a web application that I've already built out (pretty much) on a LAMP stack. The data implementation is pretty well built out so this would cut down my development time significantly. Building an API for this page would be a good exercise for me as well.

Estimate of time:

User Interface: 10 hrs

Building of API: 15 hrs

Hourly Rate:

\$20/hr.

Total Cost:

25 hrs X \$20/hr = \$500

See Appendix A for Sketches

(2) Business Rating Application

Why I want to build it:

I'm passionate about the need for adequate business rating resources for a variety of reasons. Mostly, I want to create a user friendly application that allows users to see pertinent/useful data about businesses in a way that is interactive socially. Also, there needs to be a better way to help quell the problem of fake user reviews being written for businesses who hire people to go out and write those reviews.

Estimate of time:

User Interface:	15 hrs
Building of Database Backend:	15 hrs
Hooking Up Social Media APIs:	15 hrs
Search Feature:	15 hrs
Integrating Google Search Data:	10 hrs

Hourly Rate:

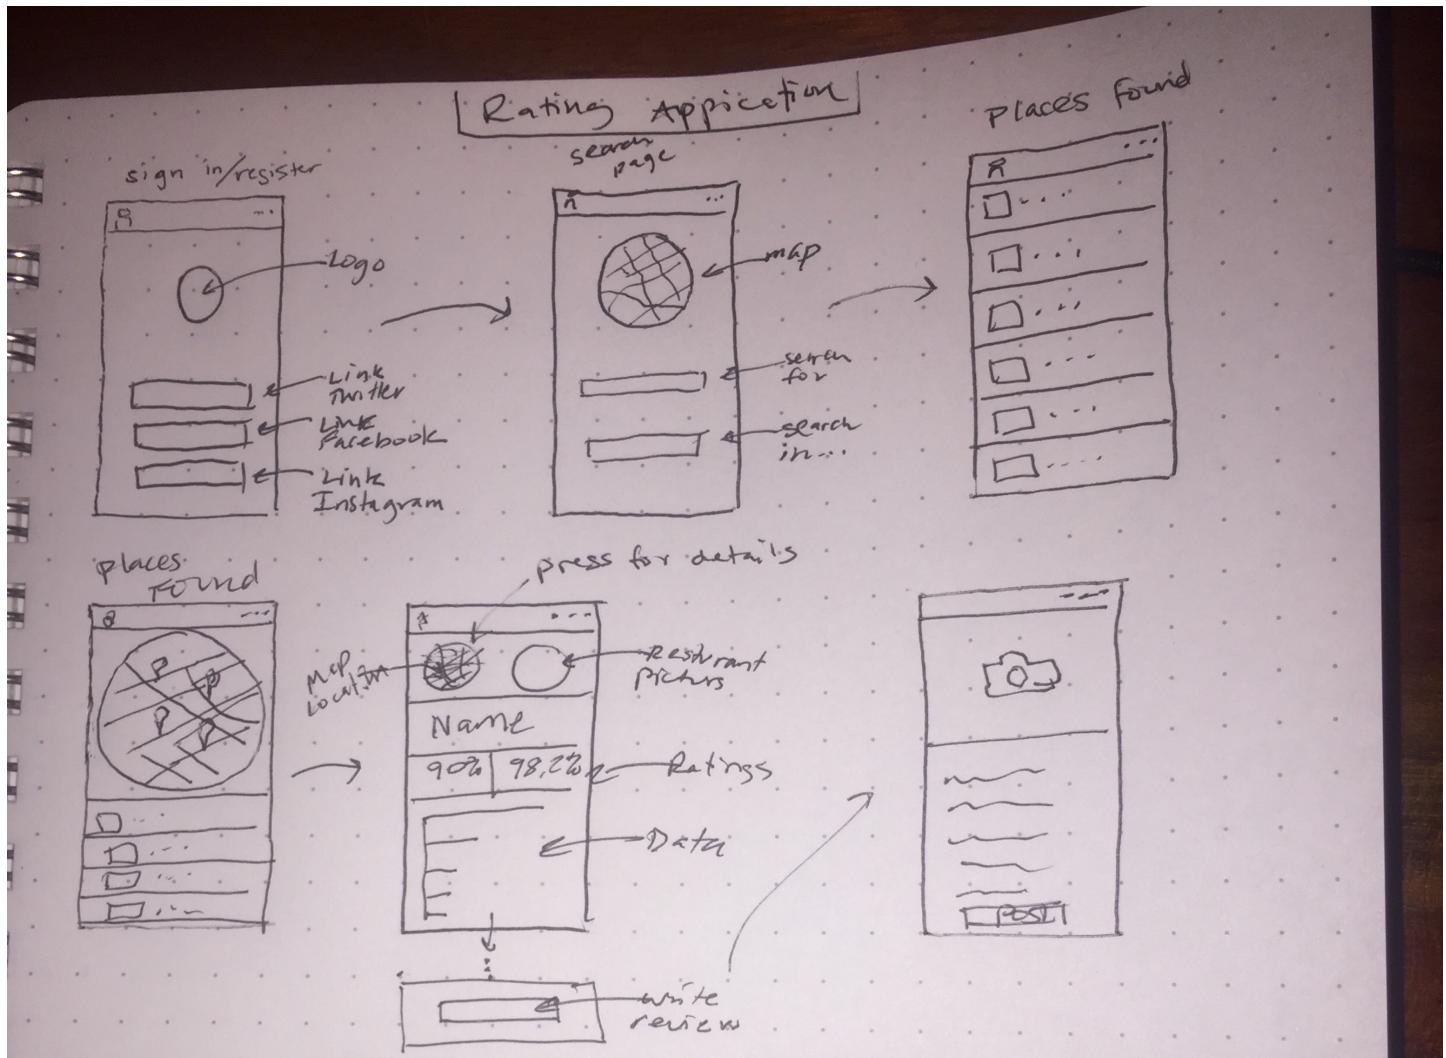

\$20/hr.

Total Cost:

70hrs X \$20/hr = \$1400

See Appendix B for Sketches
